

AI Interview Summary

Total Score: 6/100

Strengths:

- Good Technical Knowledge
- Answered Multiple Questions

Areas to Improve:

- Add More Examples
- Give Detailed Explanations

AI Evaluation:

Question:■

What are Python decorators?■

Answer:■

It is a decorator part of constructor ■

Technical Accuracy: 2/10■

Communication: 4/10■

Confidence: 8/10■

Overall Feedback: The answer displays a good level of confidence, but lacks technical accuracy and clarity in communication. A decorator is not "a decorator part of constructor" as it's actually a design pattern used to modify or extend the behavior of a function without permanently modifying it. The correct answer would be something like "A Python decorator is a special kind of function that can be applied to another function to add new functionality or modify its behavior."

■

-----■

Question:■

Explain JVM, JRE and JDK.■

Answer:■

sASANC DNNCMS VF■

Technical Accuracy: 0/10■

Communication: 0/10■

Confidence: 0/10■

Overall Feedback: This answer is completely unrelated to the question and appears to be nonsense. This suggests a lack of understanding of the topic and potentially a misunderstanding of the question itself. In an actual interview, this kind of response would likely result in the candidate being disqualified or moved to a more basic question to assess their fundamentals.■

-----■

Question:■

What is event bubbling?■

Answer:■

XN CSNNMM,MCV ■

Technical Accuracy: 0/10■

Communication: 0/10■

Confidence: 0/10■

The answer provided is entirely nonsensical. It is not a coherent response to the question, does not contain any relevant information, and seems to be gibberish. Event bubbling is an important concept in front-end development where events triggered by a child element are not just handled by the child, but also "bubble up" or propagate to parent elements until they are handled. A correct answer would involve explaining this process in detail.■

-----■

Question:■

Difference between pointer and reference?■

Answer:■

SCV NMDSAA,M VFDMS,,MV ■

Technical Accuracy: 0/10■

Communication: 0/10■

Confidence: 0/10■

Overall Feedback: The provided answer appears to be a random jumbled collection of letters and symbols. It is unclear what the respondent intended to communicate. Given the nature of the question, a suitable answer should clearly and concisely explain the main differences between pointers and references in computer programming, such as their memory management mechanisms or usage scenarios. The provided response does not meet these expectations.■

-----■

Question:■

What are React Hooks?■

Answer:■

It is a frontend part■

Technical Accuracy: 0/10■

Communication: 2/10■

Confidence: 6/10■

Overall Feedback: This answer is not accurate, not clear, and lacks confidence. The answer says only that React Hooks are a frontend part, which does not provide any information about what they actually are or how they work. A good interviewer would expect a more detailed explanation, such as "React Hooks are a way to manage state and side effects in functional components, allowing for cleaner and more predictable code."■

-----■

Question:■

Difference between SQL and MongoDB?■

Answer:■

It is a JSON format ■

Technical Accuracy: 2/10■

Communication: 3/10■

Confidence: 2/10■

Overall Feedback: The answer lacks clarity and technical accuracy. Mentioning that MongoDB uses JSON format is partially correct, but MongoDB documents are actually in JSON-like BSON (Binary Serialized Object Notation) format. A more accurate answer would also mention the key differences between SQL and MongoDB, such as SQL being a relational database management system and MongoDB being a NoSQL document-based database.■

-----■

Question:■

Explain normalization.■

Answer:■

LANAkvnkvn vc■

Technical Accuracy: 0/10■

Communication: 0/10■

Confidence: 0/10■

Overall Feedback: This answer is completely unrelated to the question and seems to be a nonsense response. It does not address the topic of normalization and appears to be an incorrect or incomplete answer. The speaker appears to lack confidence as they have chosen not to provide a relevant answer. It is unclear what this response could possibly be referencing.■

-----■

Question:■

Difference between merge and rebase?■

Answer:■

ssaAascvfndddvb■

Technical Accuracy: 0/10■

Communication: 0/10■

Confidence: 0/10■

The interview answer does not provide any information related to the difference between merge and rebase, making it a total failure in terms of both technical accuracy and communication. The answer seems to be jumbled letters, which is completely unrelated to the question.■

-----■

Question:■

What is ACID property?■

Answer:■

ASDNDNDMDNF MFVMVF.M■

Technical Accuracy: 0/10■

Communication: 0/10■

Confidence: 0/10■

The answer provided does not address the question. The response contains a jumbled collection of words and characters, making it incomprehensible and not related to the topic of ACID properties. A correct answer would have explained what ACID properties are, specifically stating that ACID stands for Atomicity, Consistency, Isolation, and Durability, which are

e essential principles in database theory for ensuring the reliability, consistency, and security of database transactions.■

-----■

Question:

Explain inheritance and polymorphism.

Answer:

Many forms and inherit property of parent class

Technical Accuracy: 2/10

Communication: 4/10

Confidence: 6/10

The answer provided is a poor representation of inheritance and polymorphism. It mentions "many forms" which could imply polymorphism but does not specifically define it. It also mentions "inherit property of parent class" which is a vague and incomplete description of inheritance. A good answer should provide clear, concise definitions and examples of both concepts.
